LOGGER

Create accurate AS-BROADCAST playout logs

Logger tracks all primary and secondary events, including commercial items. It is able to do this as all events are carried out from one system. If you switch to a backup system logger is able to read the switch log and process it against logs from each Player system (main and backup) to create an AS-BROADCAST log.

In a standard automation system it can often only track the triggers sent to third party equipment, and AS-RUN logs from a single piece of equipment needs to be consolidated with all the other broadcast equipment. Logger automates this entire process in an OASYS workflow, and then allows you to analyse the logs.

At a glance software features:

- Define machine switch sources
- Process AS-RUN and switch logs to create consolidated log
- Process consolidated logs and use filters to analyse and save extracts
- Save extracts in text or XML format
- Select what text fields are saved

Analyse and filter logs
